Regulation (EU) 2019/1021 on Persistent Organic Pollutants

Persistent organic pollutants are organic compounds that are broken down or converted very slowly, accumulate in organisms and cause harmful effects, and can be transported over long distances. The Stockholm Convention from 2001, already signed by the Federal Republic of Germany, regulates the handling of persistent organic pollutants (POPs).

We confirm that the chemical composition of our finished product, the precision steel tube, does not contain any persistent organic pollutants.

Furthermore, according to the information currently available to us, standard handling does not lead to the adherence of critical substances to our tubes as defined by Regulation (EU) 2019/1021, due to environmental and surrounding influences.

Should we discover, or be informed by a supplier, that critical substances are present on our products, we commit to publishing this information on our website without delay.

Best regards

Mannesmann Precision Tubes GmbH
